It currently consists of 20 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AL359452

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypep:ides (AAA38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as alzehimer's, parkingon's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activitities such as Immune system suppression, activing highlights, chemotractic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and or a disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                specification.

                                                                        The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activiny, inhibin activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and cassays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                19-JUL-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2001-488901/53.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAM01992 standard; frotein; 79 AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI575:6). The present sequence is a peptide encoded by one such probe. The projes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human manatic diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

This polypeptide comprises a novel human polyhomeotic 1 protein encoded by the hph1 oncogene that is implicated in neoplastic disorders. Also claimed are: (1) an hph1 polypeptide consisting at least 22 contiguous amino acids; (2) an hph1 fusion protein; antibodies which specifically bind to a hph1 protein; (4) an expression construct for expressing all or a portion of hph1 protein; (5) a homologously recombinant cell; (6) a method of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIFO at fifth. WiFO.int/pub/published_pct_sequences.

The products can also be used to inhibit hphl expression to suppress neoplasia, dysplasia, or hyperplastic cell growth. They can be used to treat e.g. tumours, anhydric hereditary ectodermal dysplasia, congenital alveolar dysplasia, epithelial dysplasia of the cervix, fibrous dysplasia of bone, or mammary dysplasia, endometrial, adrenal, breast, prostate, or thyroid hyperplasia or pseudo-epitheliomatous hyperplasia of the skin. Even in disorders in which hphl mutations are not implicated,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             identifying neoplastic tissue of a human, where over-expression of the hph1 gene identifies the tissue as being neoplastic; (7) a method to aid in the diagnosis or prognosis of neoplasia, where a difference in the hph1 gene, mRNA, or protein between a first and second tissues indicates neoplasia in the first tissue; (8) a method to aid in detecting a genetic predisposition to neoplasia; (9) a method of identifying a human chromosome 12; and (10) a method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             to suppress tumours.

In these disorders, decreasing hph1 expression can help suppress tumours. Similarly, in tumours where hph1 expression is aberrant, effecting hph1 down-regulation can suppress metastases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes a novel human tumour suppressor gene termed polyhomeotic 1 (hph1). The hph1 gene maps to human chromosome 12pl3, a region which is frequently lost in non-small cell lung cancer and breast cancer. A method of identifying neoplastic tissue of a human comprises comparing the expression of a hph1 gene in a tissue of a human suspected of being neoplastic with the expression of a hph1 gene in a tissue of the human which is normal. Under-expression of the hph1 gene identifies the subject as having neoplastic tissue. The hph1 oncogene functions to suppress neoplastia and dysplastic or hyperplastic cell growth as well as to induce cellular differentiation. The cDNA, protein and vectors can be used as diagnostic and therapeutic tools for proliferative and developmental disorders and to identify a pl3 region of a human chromosome 12. They can be used for the detection, diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A tumour suppressor gene called polyhomeotic 1 (hph1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tumour suppressor gene; polyhomeotic 1; hph1; human chromosome 12p13; identification; neoplastic tissue; cellular differentiation; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                            or prognosis of neoplasia or for detecting a genetic predisposition neoplasia. They can also be used to treat tumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                        modulate polyglutamine toxicity using animal models with polyglutamine sequences that cause toxicity in the animal. The model is preferably Drosophila, and toxic polyglutamine sequences include the human and Drosophila heat shock protein 40/HDJI, tetratricopeptide repeat protein (TPR2) and myeloid leukaemia factor 1 (MLF) genes. The model is useful for identifying treatments for neurodegenerative and proliferative disorders, including Alzheimer's disease, Parkinson's disease, Creutzfeldt-Jacob's disease (CJD), bovine spongiform encephalopathy (BSE), Huntington's disease, Machado-Joseph disease, spinocerebellar ataxias, dentatorubropallidoluysian atrophy, Kennedy's disease, stroke,
                                                                                                                                                                                                                                       The present invention describes a method of screening for genes which

                                                                                                                                                                                                                                                                                               The present invention describes a method for inhibiting the formation of aggregates of certain proteins, involving contacting the protein with a binding molecule known as an intrabody. Proteins to be bound include those associated with neurological disorders, and so the method can be used in the prevention of diseases such as Alzheimer's, Parkinson's and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Q
                       used in the prevention of diseases such as Alzheimer's, Parkinson's Huntington's diseases, prion disease, frontotemporal dementia, amyotrophic lateral sclerosis, spinal and bulbar muscular atrophy, dentatorubal-pallidoluysian atrophy, spinocerebellar ataxia type 1 (SCA1), SCA2, SCA3, SCA4, SCA5, SCA6 and SCA7.
                                                                                                  The present invention describes a method for inhibiting the formation aggregates of certain proteins, involving contacting the protein with binding molecule known as an intrabody. Proteins to be bound include those associated with neurological disorders, and so the method can be
                                                                                                                                                                                                                                                                        WPI;

                                                                                                                                                                                                                                                      The present sequence represents a murine PCTG4 protein. Polymorphisms CC in the human PCTG4 region of chromosome xq13 are associated with mental retardation, autism, depression, bipolar affective disorder or hypothyroidism. One 12 bp insertion polymorphism occurs within the C coding region of the human OPA gene, and introduces a 4 amino acid consertion in a putative OPA domain. This domain has been shown to be involved in tissue specific expression. Another polymorphism consists C of a pentanucleotide repeat approximately 7 kb upstream of the 12 bp CC oplymorphism. Another polymorphism. The CC oplymorphism. Another polymorphism consists of a dinucleotide repeat approximately 4.5 kb downstream of the 12 bp polymorphism. The CC specification describes a method for screening for polymorphisms in a CC sequences within the q13 region of the X chromosome have polymorphisms CC associated with neuropsychiatric disorders. The methods can be used to screen for the presence of a heritably linked form of mental retardation, autism, depression, bipolar affective disorder or hypothyroidism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; PCTG4 region; X chromosome; q13 region; polymorphism; mental retardation; autism; depression; bipolar affective disorder; hypothyroidism; OPA gene; neuropsychiatric disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 13
                                              The present sequence represents a CBP protein. A probe derived from the CBP protein is used to isolate a Drosophila cellular protein, designated 532. Protein 532 interacts with proteins involved in the control of cell proliferation, in particular partners of p300/CBP and Rb proteins. The cellular proteins of the invention are used for in vitro screening of compounds (including immunosuppressants) which are able to interact physically and/or functionally with them, particularly to determine sensitivity of the protein to immunosuppressants or to identify capacity to interact with Ela viral proteins. The proteins can be used to induce (or interfere with) cellular differentiation and proliferation, including formation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as localised neuropathies and central nervous system diseases, such as alzheiner's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tang

                                                                                                           The present sequence represents the mature glutenin protein. The DNA sequence encoding this protein is isolated from the genomic DNA of Triticum durum L. The gene codes for a low-molecular-weight glutenin protein and can be used to produce transgenic durum wheat plants with "better quality characteristics" [no details given].
